CIRCUIT DESCRIPTION

(1) Frequency configuration

- The TH-79 A/E has independent PLL circuits for the VHF and UHF bands. It also has two IF channels, so both bands can receive at the same time.
- Each band has a sub-reception circuit (Sub-VHF, Sub-UHF), so both VHF and UHF waves can be received (V x V, U x U) simultaneously.
- The Sub-VHF 1st-LOCAL is made from the halving of UHF-VCO.
- The Sub-UHF 1st-LOCAL is made by doubling the VHF-VCO.

The VHF 2nd-LOCAL is made by tripling the REF-OSC (12.8MHz).

- The frequency configuration is as shown in Fig. 1 and Table 1.

Example : E,T type

CIRCUIT DESCRIPTION

[UHF reception]

The 1st-LOCAL signal (lower hetero) made from the direct oscillation of the U-VCO's IC9 (KCH-17) is mixed with the desired signal to become the IFU's 45.05MHz. It is further mixed with the 2nd-LOCAL signal (upper hetero) from the X1's quartz crystal oscillation circuit to become 455kHz, is quadrature detected at IC2 and becomes an audio signal.

[VHF reception]

The 1st-LOCAL signal (upper hetero) made from the direct oscillation of the V-VCO's IC10 (KCH-16) is mixed with the desired signal to become the IFV's 38.85MHz. It is further mixed with the 2nd-LOCAL signal (lower hetero) to become 450kHz, is quadrature detected at IC1 and becomes an audio signal.

[Sub-VHF reception]

The Sub-VHF is mixed with the 1st-LOCAL (upper hetero), made by the halving of U-VCO, to become IFU 45.05 MHz.

[Sub-UHF reception]

The Sub-UHF is mixed with the 1st-LOCAL (lower hetero), made by the doubling of V-VCO, to become IFV 38.85 MHz.

[Audio circuitry]

- Audio signals AFU and AFV detected at IC1 and IC2 enter cross-point switch IC312 and are switched to either AFL or AFR. AFL and AFR pass through VOL[A] and VOL[B], re-enter IC312 and are switched to either IN.SP or EXT.SP. These signals are amplified by independent audio amplifiers IC315 and IC316 and are output either by the internal or the external speaker.
- IC312's control signal, beep sound, and DTMF signal are output from microprocessor IC304.

CIRCUIT DESCRIPTION

(3) Transmission signal channel

The transmission system diagram is as shown in Fig. 3.

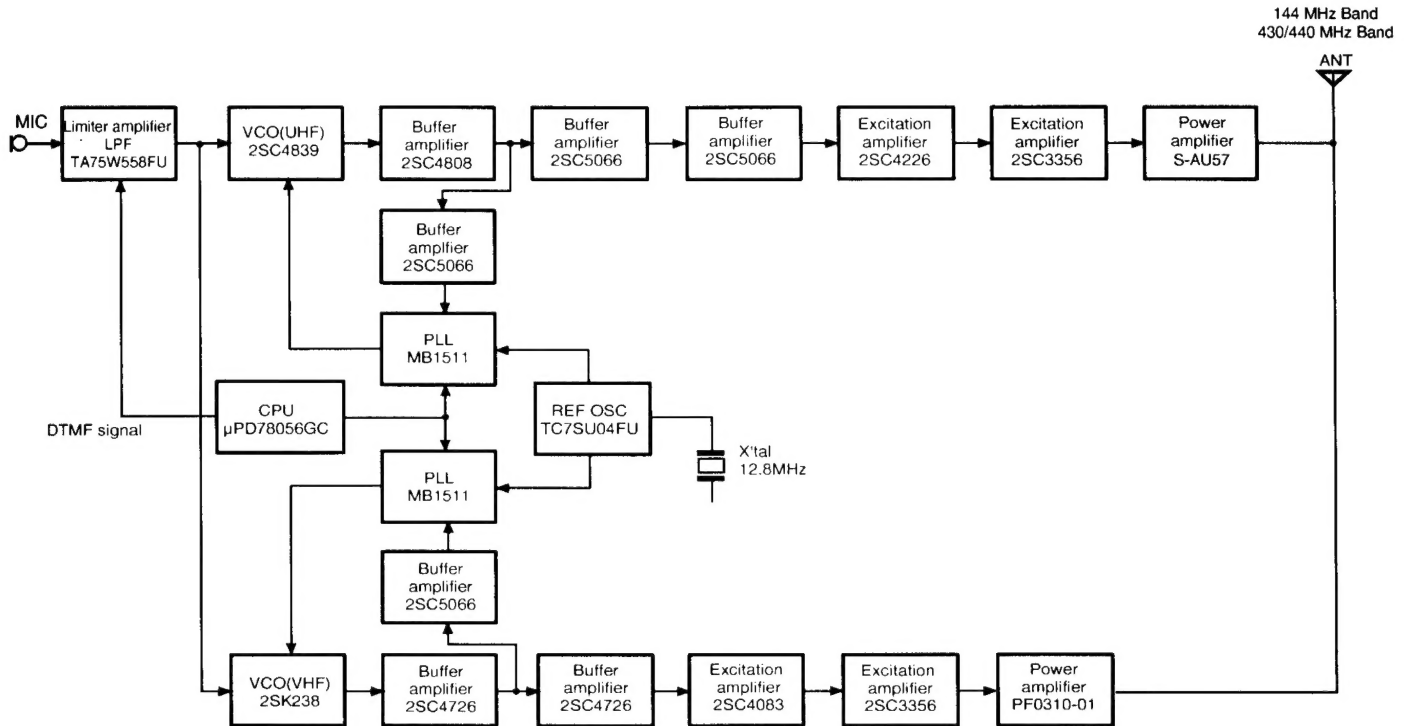

Fig.3 Transmission system diagram

3-1 Modulation circuit

The audio signal from the microphone is subjected to pre-emphasis, limiter amplification, and splatter filtering by the IC308 (TA75W558FU). VHF/UHF switching is done by Q337, and frequency deviation is adjusted by VR301 and V302.

The modulation signal is applied to the modulation varicaps of the VCOs for both VHF and UHF, and undergoes reactance modulation. When DTMF is used, the input terminals are shorted at Q301.

3-2 Driver, final amplifier

VHF band VCO output is amplified by a two-stage and UHF band VCO output by a three-stage amplifier, after which they are each input to their respective power modules. After passing through each band's antenna switches, the output passes through the chip duplexer (L60) and is supplied to the antenna.

3-3 APC circuit

The APC circuit is for stabilizing transmission output. It detects the power module's drain current and regulates the transmission output. We shall explain using the UHF band as an example. (Fig. 4)

To differential DC amplifier IC317 is applied the reference

voltage obtained by potential division of voltage-regulated zener diode D316 through transmission output adjustment VR307 (EL power), R420, VR305 (Hi power) and R421, as well as the detection voltage generated by R434, R435 and R436 in proportion to the power module's drain current. The output of IC317 (No. 6 pin) outputs voltage in proportion to the difference between the reference voltage and the detection voltage, which is inverted at Q335, giving the APC voltage. This APC voltage regulates the power module's power regulation terminal, maintaining a constant transmission output. Also, when the transmission is turned off, Q324 turns off and Q305 turns on, rapidly discharging the APC voltage, for stable turning off of the power module. Transmission output switching is regulated by Q320 shift register, varying the reference voltage to fix the transmission output at approximately 4.7W (Hi), approximately 0.5W (Low) and approximately 30mW (EL).

3-4 Temperature protection circuit

To prevent thermal destruction of the power module, if the thermistor detects a temperature level of approximately 100° C, Q32 is turned on and the APC voltage is lowered to the level of the D20 zener diode voltage.

CIRCUIT DESCRIPTION

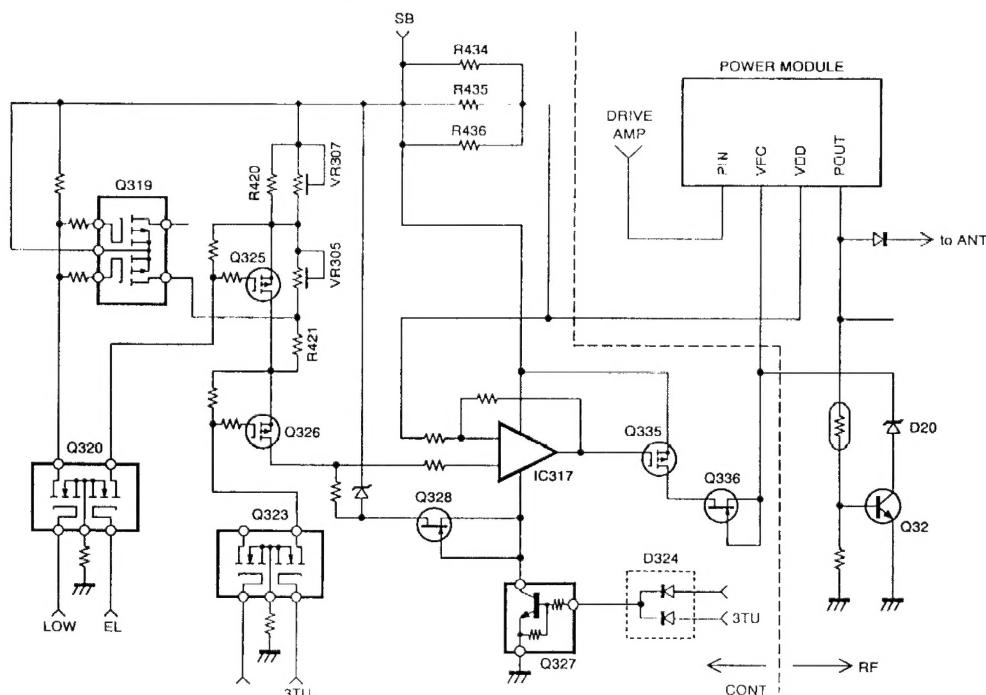

Fig. 4 APC / Temperature protection circuit (in the case of UHF)

(4) PLL circuit

The VHF and UHF bands each have independent PLLs and VCOs. The Ref OSC makes an independent oscillation circuit, applied oscillator signal to the V/U PLL IC and the tripling bipolar transistor.

● Reference oscillation circuit

X2: the 12.8MHz quartz crystal oscillates at IC11, the output of which is distributed and applied to IC4 and IC5. The reference oscillation frequency is divided at IC4 (VHF) and IC5 (UHF) to obtain 5kHz and 6.25kHz reference frequencies.

● Phase comparison

After amplifying the VCO output at Q22 (VHF) and Q21 (UHF), the comparison frequency is distributed at pulse swallow type PLL ICs IC4 and IC5.

Through phase comparison with the reference frequency obtained by dividing X2, a PLL synthesizer of 5kHz, 10kHz, 12.5kHz, 15kHz, 20kHz and 25kHz steps is configured.

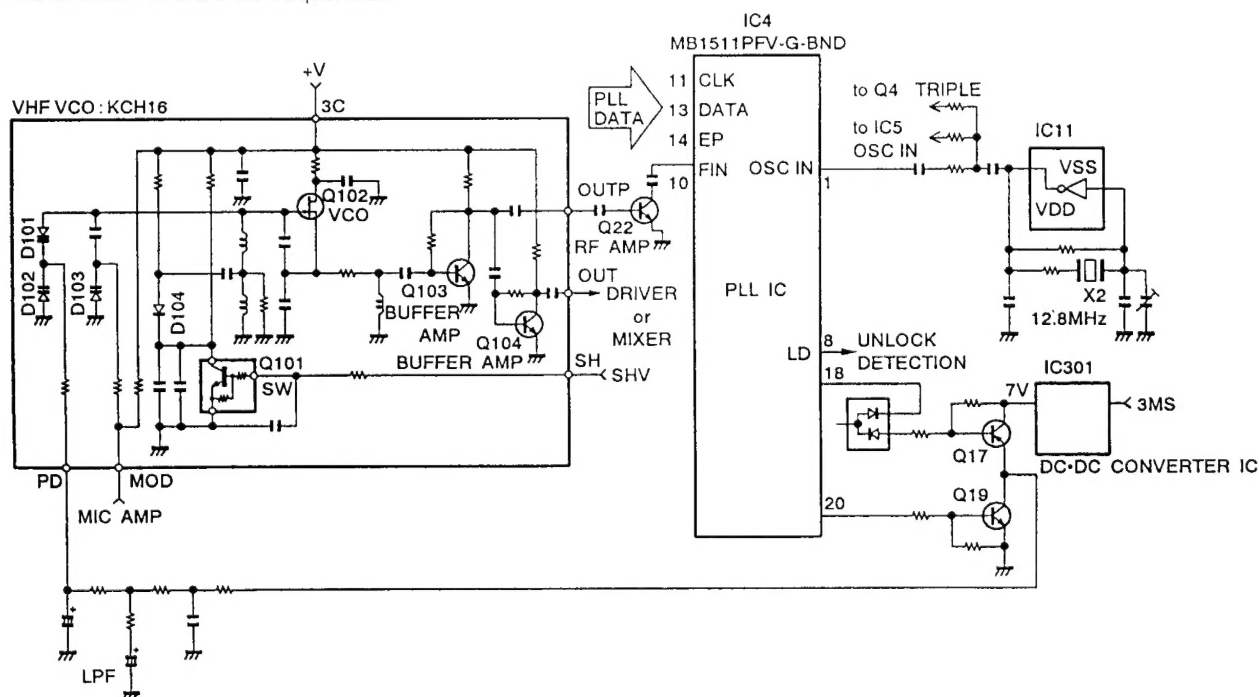

Fig. 5 PLL, VHF VCO circuit

CIRCUIT DESCRIPTION

● Lock voltage(VCO regulation voltage)

Due to the phase difference between the reference voltage and the comparison voltage, the pulse output from the 18th and 20th pins of IC4 is passed through the charge pump (Q17, Q19), has ripples removed at the LPF and becomes the lock voltage.

The charge pump power supply is stepped up from 3M at the DC-DC converter, raising to approximately 7V.

● VHF VCO (KCH16)

VHF VCO (KCH16), FET: directly oscillates the target frequency at the Colpitts oscillator circuit of Q102. The VCO regulation voltage is applied to varicap D101 and D102, changing the oscillation frequency. Also, during reception the T/R terminal becomes "H," turning on Q101 and D104 and switching the oscillation frequency.

During transmission, the audio signal is applied to varicap D103 to modulate the oscillation frequency.

● UHF VCO (KCH17)

UHF VCO (KCH17), bipolar transistor: directly oscillates the target frequency at the Colpitts oscillator circuit of Q2. The VCO regulation voltage is applied to varicap D1 and D2, changing the oscillation frequency. Also, during reception the T/R terminal becomes "L," turning off Q1 and D4 and switching the oscillation frequency.

During transmission, the audio signal is applied to varicap D4 to modulate the oscillation frequency.

● Unlock detection circuit

When the PLL is unlocked, the pulse output to IC4's LD terminal (pin No. 8) is waveform shaped at D7, R66 and C71, turning UL terminal A to the "L" level. the UL terminal voltage is detected at the microprocessor, regulating the timing off transmission/reception switching.

CIRCUIT DESCRIPTION

(5) Power supply circuit

5-1 Ni-Cd recharge circuit

A constant current of approximately 70mA is supplied to the Ni-Cd battery from the external power supply connected to the DC IN terminal, via the constant current circuit comprised by Q1 and D1.

If an external power supply is not connected to the DC IN terminal, the constant current circuit does not operate.

5-2 Power supply switching circuit

The power supply circuit is configured as shown in Fig. 8. Its branches are as follows.

RB	Power module power supply
3C	PLL (3CV, 3CU), reception circuit (3RV, 3RU, 3RSU, 3RSV, 3R36, 3R80, 3R43, 3R14) power supply

CIRCUIT DESCRIPTION

(6) Microprocessor and peripheral circuits**6-1 Reset backup circuit**

When SB is turned on, microprocessor IC304's V_{DD} and INT become +3.5V "H" as C235 charges. At this time, simultaneously with the microprocessor's actuation, \overline{RST} becomes active, after which R340, C333 are cleared a few minutes later.

When SB is set OFF, voltage detect IC307 detects the 3M line voltage drop (3.0V) and sets the INT port to "L" when this happens the microprocessor enters backup mode, sends data to IC302 (E²PROM). While C325 is discharging, the E²PROM receives data, which is written internally. As the 3M line voltage

falls further to below 2.3V, voltage detect IC310 detects the voltage drop (2.3V), sets the \overline{RST} port to "L" and the \overline{RST} becomes active.

6-2 Battery voltage detection circuit

This divides the power supply voltage and inputs it to the microprocessor's analog port. It outputs a warning sound if the power supply voltage exceeds about 17.5~22.0V. The voltage input to the microprocessor during transmission is linked to the A/D converted LCD BATT display.

CIRCUIT DESCRIPTION

(7) Battery save circuit

- When a condition of squelch off, scan off, and no key operation input continues for 10 seconds, the battery save mode is entered.
- The signal output from the microprocessor's SAVE terminal turns Q312 on/off at a period of 200msec/800msec (200msec/200msec when DTSS basic functions are on). As

a result, each section's power supply is also turned on/off in the same fashion, reducing power consumption while in the wait mode.

(8) LED drive circuit

The LCD illumination LED is built into the LCD ASSY, and regulates the Q317 at the microprocessor port. (Fig. 11)

The TX, BUSY LEDs are controlled by pulling the cathode sides of 2 color LEDs D319 and D320 to the shift register, IC314. (Fig. 12)

CIRCUIT DESCRIPTION

(10) Auxiliary circuits

● CTCSS

This sets the tone frequency with data from the microprocessor (IC304). Audio input is wave detection output entered to "TSU-8" via the cross-point switch (IC11).

When the tones match, the SDO terminal turns to the "L" level. The microprocessor decides and regulates SDO terminal audio output(X-point and AFC IN, AFC EX, AI2, AE2, 3RL, 3RR each port).

During TONE signal transmission, the TONE signal is output and modulated via the LPF from the microprocessor TONE port(pin No. 5).

● DTSS

DTMF code I/O is done with serial data from the microprocessor. As with CTCSS, audio input is entered from the cross-point switch. When it detects the DTMF signal, that data is sent to the microprocessor. The microprocessor decides matching codes and regulates audio output.

During DTMF signal transmission the DTMF signal is output from the microprocessor DTMF port(pin No. 6). Microphone input is regulated by the KM terminal. The DTMF signal is modulated through the microphone amplifier. During DTMF signal transmission, the DTMF signal can be monitored from the SP, through the cross-point switch.

● DTMF decode timing

The single DTMF decode IC actuates both operated and non-operated bands. During single band operation, only the main band is checked. During dual band operation, the circuit switches to and checks the busy band. Accordingly, there may be occasions when, if both the operated and non-operated bands are busy at the same time, one band cannot be checked.

DTMF decoder IC : LC73881M(IC305)

●Pin connection diagram

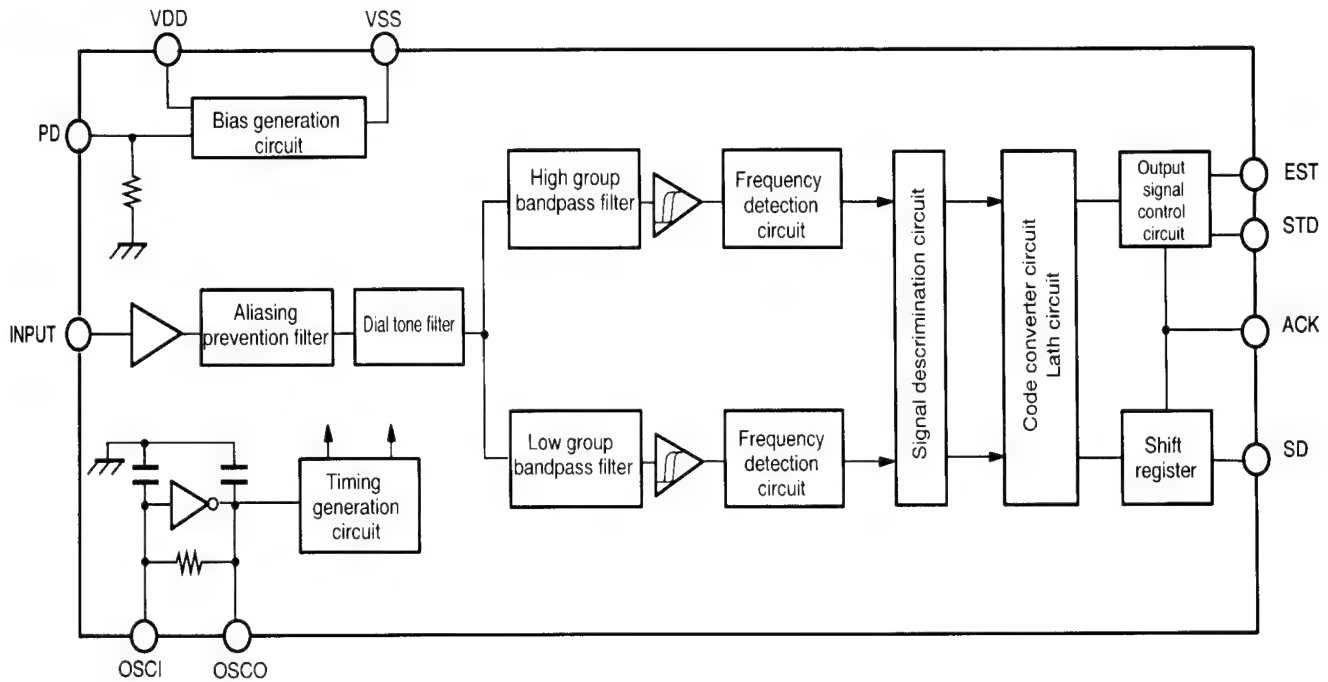

●Pin description

Pin No.	Pin Name	I/O	Description
1	INPUT	I	An input coupling condenser is required. Internally biased to VDD/2.
2	PD	I	By setting this pin to "H," power down mode is entered.
3	OSCO	O	A 4.19430MHz quartz oscillator or a ceramic generator is connected between these terminals to configure the oscillation circuit.
4	OSCI	I	
5	VSS		Power supply terminal, normally 0V
6	SD	O	Decoded DTMF output is output as 4-bit serial, led by the LSB.
7	ACK	I	The ACK pin is used to shift out data to the SD pin. Four pulses are needed to needed to shift out DTMF characters comprised by four bits. The first pulse has a function that latches data before shifting.
8	STD	O	"H" indicates the existence of a DTMF signal. Compared with the EST pin, this pin has a slower response to input signals, but it is insensitive to burst waves and the like.
9	EST	O	"H" indicates the existence of a DTMF signal. This pin provides external monitoring. After an appropriate period of time has passed, it applies four pulses to ACK to access data.
10	VDD		Power supply terminal, normally 2.7~5.5V

Preparation

- Set the unit in the receiving mode and set the controls as follows, unless otherwise specified.

VHF AF VR MIN
 UHF AF VR MIN
 LOW KEY HI

- Use a non-conductive rod such as a Bakelite rod for adjustment (especially of trimmers and coils).
- To protect the SSG, do not send out signals while adjusting the receiving unit.
- The indicated SSG output levels are for maximum output.

And whenever there is no modulation designation, standard modulation (MOD: 1kHz, DEV: ±3kHz) is indicated.

How to use the "Set Mode"

About the "Set Mode"

When this unit is placed in the "Set Mode," the following levels can be set.

1. Each band's squelch critical point
2. Each band's S meter first group illumination
3. Each band's S meter total illumination
4. Excessive voltage warning reference voltage (13.8V)

Levels set in the "Set Mode" are written to the E²PROM. As a result, the written data is preserved even if the power supply is cut off or the unit is reset.

Also, if the E²PROM is replaced, all items need to be rewritten (reset).

Setting procedures

1. Set the dual band mode for use (DUAL) key.
2. Open the main unit. With the power on, momentarily short the TX-RX unit (A/7) part surface test point TB 1 and TB 2 with tweezers equipment.
 - The LCD's non-actuated band side displays -Set Mode-, indicating that the Set Mode has been entered.
 - Key functions during "Set Mode" are as follows.
 - (1) : Squelch critical point (■ □ □ □ □) setting
 - (2) : S meter first group illumination level setting
 - (3) : S meter total illumination level setting
 - (4) : Excessive voltage warning reference voltage (13.8V) recognition setting
 - (5) : Excessive voltage warning recognition mode (warning sounds)
 - (6) : Cancellation of (5) (turning the power off is also possible)
 - (LOW) : V × V / U × U changeover
 - (DUAL) : 430/800 or 144/300's changeover
 - (SHIFT), (DUAL), (DUAL) : 300's AM/FM changeover (During Set Mode, the F, MENU, SQL, REV, 0 and 7~9 keys do not receive.)

Example : E,T type

3. Input each band's designated SSG level from the ANT terminal and press each SET key. (Table below)

Band (SSG FREQ.)	1	2	3
UHF(439.94MHz)	-128dBm (0.09μV)	-121dBm (0.2μV)	-111dBm (0.63μV)
VHF(145.94MHz)	-128dBm (0.09μV)	-122dBm (0.18μV)	-112dBm (0.56μV)
Sub-U(439.94MHz)	-127dBm (0.1μV)	-120dBm (0.23μV)	-110dBm (0.7μV)
Sub-V(145.94MHz)	-127dBm (0.1μV)	-120dBm (0.23μV)	-110dBm (0.7μV)
300/FM(380.025MHz)	-128dBm (0.09μV)		
300/AM(380.025MHz)	-122dBm (0.18μV)		
AIR/AM(120.025MHz)	-122dBm (0.18μV)		
800/FM(860.080MHz)	-122dBm (0.18μV)		

4. Excessive voltage warning reference voltage (13.8V) recognition setting
Apply a terminal voltage of 13.8V±0.05V from a stabilizing power supply connected to the external power supply terminal (DC IN) and press key (4).
Next press key (5) and confirm that a warning sound can be heard.
5. The "Set Mode" is cleared when the power is turned off.
6. Turn on the power supply while pressing (VFO) and reset VFO.

(Note 1) Each setting overwrites the previous data, so they can be set independently and in any order.

(Note 2) Even if reception expansion is not done, the 300, 800 and AIR squelch settings can be done.

(Note 3) Switching from AIR can be operated from VHF by the encoder.
